

## Partea 1:

Studiarea si (re)configurarea unui serviciu deja instalat (ex. ssh) #verificati existenta userilor "user1" si "user2" si resetati parolele

```
aso@aso-b:~$ sudo useradd -c "user1" -m -d /home/user1 -s /bin/bash -p $(openssl passwd -1 -salt 146 user1pass) user1
aso@aso-b:~$ sudo useradd -c "user2" -m -d /home/user2 -s /bin/bash -p $(openssl passwd -1 -salt 146 user2pass) user2
aso@aso-b:~$
```

```
vboxadd:x:998:1::/var/run/vboxadd:/bin/false
dnsmasq:x:113:65534:dnsmasq,,,:/var/lib/misc:/usr/sbin/nologin
user1:x:1001:1001:user1:/home/user1:/bin/bash
user2:x:1002:1002:user2:/home/user2:/bin/bash
aso@aso-b:~$
```

### 1. Studiarea fisierului de configurare PAM(/etc/pam.conf)

```
aso@aso-b:~$ cat /etc/pam.conf
# -----#
# /etc/pam.conf                                     #
# -----#
#
# NOTE
# ----
#
# NOTE: Most program use a file under the /etc/pam.d/ directory to setup their
# PAM service modules. This file is used only if that directory does not exist.
# -----#

# Format:
# serv. module      ctrl      module [path]      ...[args..]      #
# name type         flag                                     #
aso@aso-b:~$
```

```

aso@aso-b:~$ cat /etc/pam.d/sshd
# PAM configuration for the Secure Shell service

# Standard Un*x authentication.
@include common-auth

# Disallow non-root logins when /etc/nologin exists.
account    required    pam_nologin.so

# Uncomment and edit /etc/security/access.conf if you need to set complex
# access limits that are hard to express in sshd_config.
# account  required    pam_access.so

# Standard Un*x authorization.
@include common-account

# SELinux needs to be the first session rule. This ensures that any
# lingering context has been cleared. Without this it is possible that a
# module could execute code in the wrong domain.
session [success=ok ignore=ignore module_unknown=ignore default=bad]    pam_selinux.so close

# Set the loginuid process attribute.
session    required    pam_loginuid.so

# Create a new session keyring.
session    optional    pam_keyinit.so force revoke

# Standard Un*x session setup and teardown.
@include common-session

# Print the message of the day upon successful login.
# This includes a dynamically generated part from /run/motd.dynamic
# and a static (admin-editable) part from /etc/motd.
session    optional    pam_motd.so motd=/run/motd.dynamic
session    optional    pam_motd.so noupdate

# Print the status of the user's mailbox upon successful login.
session    optional    pam_mail.so standard noenv # [1]

# Set up user limits from /etc/security/limits.conf.
session    required    pam_limits.so

# Read environment variables from /etc/environment and
# /etc/security/pam_env.conf.
session    required    pam_env.so # [1]
# In Debian 4.0 (etch), locale-related environment variables were moved to
# /etc/default/locale, so read that as well.
session    required    pam_env.so user_readenv=1 envfile=/etc/default/locale

# SELinux needs to intervene at login time to ensure that the process starts
# in the proper default security context. Only sessions which are intended
# to run in the user's context should be run after this.
session [success=ok ignore=ignore module_unknown=ignore default=bad]    pam_selinux.so open

# Standard Un*x password updating.
@include common-password
aso@aso-b:~$

```

## 2. Restricționarea accesului unui utilizator specificat

### 2.1. Adăugați: "auth required pam\_listfile.so item=user sense=deny file=/etc/ssh/sshd.deny onerr=succeed"

```

aso@aso-b:~$ sudo nano /etc/pam.d/sshd
aso@aso-b:~$ cat /etc/pam.d/sshd
# PAM configuration for the Secure Shell service
auth required pam_listfile.so item=user sense=deny file=/etc/ssh/sshd.deny onerr=succeed

```

- 2.2. Adăugați "user1" in "/etc/ssh/sshd.deny".

```
aso@aso-b:~$ sudo nano /etc/ssh/sshd.deny
aso@aso-b:~$ sudo cat /etc/ssh/sshd.deny
user1
aso@aso-b:~$ |
```

- 2.3. Reporniți serviciul ssh: "sudo service ssh restart".

```
aso@aso-b:~$ sudo service ssh restart
aso@aso-b:~$ |
```

- 2.4. Verificați conectarea cu user1 si user2 pe serviciul ssh folosit comanda ssh user<N>@localhost

```
PS C:\Users\dansi> ssh user1@localhost -p 2202
user1@localhost's password:
Permission denied, please try again.
user1@localhost's password:
Permission denied, please try again.
user1@localhost's password:
user1@localhost: Permission denied (publickey,password).
PS C:\Users\dansi> ssh user2@localhost -p 2202
user2@localhost's password:
Welcome to Ubuntu 22.04 LTS (GNU/Linux 5.15.0-48-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Tue Nov 18 07:03:20 AM UTC 2025

System load:                0.0
Usage of /:                  47.4% of 19.51GB
Memory usage:               17%

57 updates can be applied immediately.
To see these additional updates run: apt list --upgradable

The list of available updates is more than a week old.
To check for new updates run: sudo apt update
New release '24.04.3 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

Last login: Tue Nov 18 07:02:17 2025 from 10.0.2.2
user2@aso-b:~$
```

3. Restricționarea completă a unui serviciu (toți utilizatorii)

3.1. Comentați regula din pasul precedent.

3.2. Adăugați: "auth required pam\_deny.so"

```
aso@aso-b:~$ sudo nano /etc/pam.d/sshd
aso@aso-b:~$ cat /etc/pam.d/sshd
# PAM configuration for the Secure Shell service
#auth required pam_listfile.so item=user sense=deny file=/etc/ssh/sshd.deny onerr=succeed
auth required pam_deny.so
```

3.3. Reporniți serviciul ssh: "sudo service ssh restart".

```
aso@aso-b:~$ sudo service ssh restart
aso@aso-b:~$ |
```

3.4. Verificați conectarea cu user1 si user2 pe serviciul ssh.

```

user2@localhost: Permission denied (publickey,password).
PS C:\Users\dansi> |
```

#### 4. Adăugarea modulului de restrictionare acces pam\_time

- 4.1. Adăugați regula: "account required pam\_time.so" in fisierul "/etc/pam.d/sshd".

```
aso@aso-b:~$ sudo nano /etc/pam.d/sshd
aso@aso-b:~$ sudo cat /etc/pam.d/sshd
# PAM configuration for the Secure Shell service
#auth required pam_listfile.so item=user sense=deny file=/etc/ssh/ssh.deny onerr=succeed
#auth required pam_deny.so
account required pam_time.so

# Standard Unix authentication.
```

- 4.2. Adăugați restricție de timp in fisierul "/etc/security/time.conf".

- 4.3. Studiați exemplelor din "/etc/security/time.conf".

- 4.4. Restrictionati serviciul "sshd" pentru user1 in ziua de Vineri intre orele 17-20.

```
aso@aso-b:~$ sudo nano /etc/security/time.conf
aso@aso-b:~$ sudo cat /etc/security/time.conf
# this is an example configuration file for the pam_time module. Its syntax
# was initially based heavily on that of the shadow package (shadow-960129).
#
# the syntax of the lines is as follows:
#
#      services;ttys;users;times
#
# white space is ignored and lines maybe extended with '\\n' (escaped
# newlines). As should be clear from reading these comments,
# text following a '#' is ignored to the end of the line.
#
# the combination of individual users/terminals etc is a logic list
# namely individual tokens that are optionally prefixed with '!' (logical
# not) and separated with '&' (logical and) and '|' (logical or).
#
# services
#      is a logic list of PAM service names that the rule applies to.
#
# ttys
#      is a logic list of terminal names that this rule applies to.
#
# users
#      is a logic list of users or a netgroup of users to whom this
#      rule applies.
#
# NB. For these items the simple wildcard '*' may be used only once.
#
# times
#      the format here is a logic list of day/time-range
#      entries the days are specified by a sequence of two character
#      entries, MoTuSa for example is Monday Tuesday and Saturday. Note
#      that repeated days are unset MoMo = no day, and MoWk = all weekdays
#      bar Monday. The two character combinations accepted are
#
#      Mo Tu We Th Fr Sa Su Wk Wd Al
#
#      the last two being week-end days and all 7 days of the week
#      respectively. As a final example, AlFr means all days except Friday.
#
#      each day/time-range can be prefixed with a '!' to indicate "anything
#      but"
#
#      The time-range part is two 24-hour times HHMM separated by a hyphen
#      indicating the start and finish time (if the finish time is smaller
#      than the start time it is deemed to apply on the following day).
#
# for a rule to be active, ALL of service+ttys+users must be satisfied
# by the applying process.
#
#
# Here is a simple example: running blank on tty* (any ttyXXX device),
# the users 'you' and 'me' are denied service all of the time
#
#blank;tty* & !ttyp*;you|me;!Al0000-2400
#
# Another silly example, user 'root' is denied xsh access
# from pseudo terminals at the weekend and on Mondays.
#
#xsh;ttyp*;root;!WdMo0000-2400
#
# End of example file.
#
sshd;*;user1;Fr1700-2000
aso@aso-b:~$
```

4.5. Verificati accesul cu user1 și user2.

```
PS C:\Users\dansi> ssh user1@localhost -p 2202
user1@localhost's password:
Connection closed by 127.0.0.1 port 2202
PS C:\Users\dansi> ssh user2@localhost -p 2202
user2@localhost's password:

```

### 5.2. Adăugati modulul cu parametrii "retry=3" și "minlen=6" în fișierul

/etc/pam.d/common-password

```
aso@aso-b:~$ sudo nano /etc/pam.d/common-password
aso@aso-b:~$ sudo cat /etc/pam.d/common-password
#
# /etc/pam.d/common-password - password-related modules common to all services
#
# This file is included from other service-specific PAM config files,
# and should contain a list of modules that define the services to be
# used to change user passwords. The default is pam_unix.
#
# Explanation of pam_unix options:
# The "yescrypt" option enables
# hashed passwords using the yescrypt algorithm, introduced in Debian
# 11. Without this option, the default is Unix crypt. Prior releases
# used the option "sha512"; if a shadow password hash will be shared
# between Debian 11 and older releases replace "yescrypt" with "sha512"
# for compatibility. The "obscure" option replaces the old
# 'OBSOLETE_CHECKS_ENAB' option in login.defs. See the pam_unix manpage
# for other options.
#
# As of pam 1.0.1-6, this file is managed by pam-auth-update by default.
# To take advantage of this, it is recommended that you configure any
# local modules either before or after the default block, and use
# pam-auth-update to manage selection of other modules. See
# pam-auth-update(8) for details.
#
# here are the per-package modules (the "Primary" block)
password      requisite                                pam_cracklib.so retry=3 minlen=6
password      [success=1 default=ignore]                pam_unix.so obscure use_authtok try_first_pass yescrypt
# here's the fallback if no module succeeds
password      requisite                                pam_deny.so
# prime the stack with a positive return value if there isn't one already;
# this avoids us returning an error just because nothing sets a success code
# since the modules above will each just jump around
password      required                                  pam_permit.so
# and here are more per-package modules (the "Additional" block)
# end of pam-auth-update config
aso@aso-b:~$
```

5.3. Anulati restrictiile din time.conf pentru user1

```
#
# Here is a simple example: running blank on tty* (any ttyXXX device),
# the users 'you' and 'me' are denied service all of the time
#

#blank;tty* & !ttyp*;you|me;!A10000-2400

# Another silly example, user 'root' is denied xsh access
# from pseudo terminals at the weekend and on Mondays.

#xsh;ttyp*;root;!WdMo0000-2400

#
# End of example file.
#

#sshd;*,user1;Fr1700-2000
aso@aso-b:~$
```

5.4. Resetati parola pentru user1 si testati parametrii de la pasul precedent.

```
user1@aso-b:~$ passwd
Changing password for user1.
Current password:
New password:
BAD PASSWORD: it is WAY too short
New password:
BAD PASSWORD: it is WAY too short
New password:
BAD PASSWORD: it is WAY too short
passwd: Have exhausted maximum number of retries for service
passwd: password unchanged
user1@aso-b:~$ passwd
Changing password for user1.
Current password:
New password:
BAD PASSWORD: it is based on a dictionary word
New password:
BAD PASSWORD: it is based on a dictionary word
New password:
Retype new password:
passwd: password updated successfully
user1@aso-b:~$
```

## Partea2

### 1. Instalare și configurare OpenLDAP

- 1.1. Instalați pachetele "slapd" și "ldap-utils" (NOTĂ: la finalul instalării se solicită setarea parolei de admin)

```
ubuntu@ubuntu-VirtualBox:~$ sudo apt-get install slapd ldap-utils
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
slapd is already the newest version (2.6.7+dfsg-1~exp1ubuntu8.2).
ldap-utils is already the newest version (2.6.7+dfsg-1~exp1ubuntu8.2).
The following packages were automatically installed and are no longer required:
  libaio1t64 libcgi-fast-perl libcgi-pm-perl libevent-core-2.1-7t64
  libevent-pthreads-2.1-7t64 libfcgi-bin libfcgi-perl libfcgi0t64
  libhtml-template-perl libmecab2 libprotobuf-lite32t64 mecab-ipadic
  mecab-ipadic-utf8 mecab-utils mysql-client-8.0 mysql-client-core-8.0
  mysql-common mysql-server-8.0 mysql-server-core-8.0
Use 'sudo apt autoremove' to remove them.
0 upgraded, 0 newly installed, 0 to remove and 83 not upgraded.
```

- 1.2. Configurați pachetul "slapd" prin executarea comenzii "sudo dpkg-reconfigure slapd"

Configuring slapd

The DNS domain name is used to construct the base DN of the LDAP directory. For example, 'foo.example.org' will create the directory with 'dc=foo, dc=example, dc=org' as base DN.

DNS domain name:

aso.cs.utcluj.ro

<Ok>

Configuring slapd

Please enter the name of the organization to use in the base DN of your LDAP directory.

Organization name:

lab

<Ok>

### Configuring slapd

Please enter the password for the admin entry in your LDAP directory.

Administrator password:

\*\*\*\*

<Ok>

### Configuring slapd

Do you want the database to be removed when slapd is purged?

<Yes>

<No>

### Configuring slapd

There are still files in /var/lib/ldap which will probably break the configuration process. If you enable this option, the maintainer scripts will move the old database files out of the way before creating a new database.

Move old database?

<Yes>

<No>

## 2. Instalarea și configurarea interfeței Web (phpLDAPAdmin) pentru gestiunea LDAP

### 2.1. Identificati versiunea de php pe care package manager-ul apt il ofera:

```
ubuntu@ubuntu-VirtualBox:~$ apt-cache search php
exuberant-ctags - build tag file indexes of source code definitions
libapache2-mod-php - server-side, HTML-embedded scripting language (Apache 2 module) (default)
libapache2-mod-php8.3 - server-side, HTML-embedded scripting language (Apache 2 module)
libct4 - libraries for connecting to MS SQL and Sybase SQL servers
libcups2-dev - Common UNIX Printing System(tm) - Development files CUPS library
libgtksourceview-5-common - common files for the GTK 4 syntax highlighting widget
libnet-libidn-perl - Perl bindings for GNU Libidn
php - server-side, HTML-embedded scripting language (default)
php-all-dev - package depending on all supported PHP development packages
php-cgi - server-side, HTML-embedded scripting language (CGI binary) (default)
php-cli - command-line interpreter for the PHP scripting language (default)
php-common - Common files for PHP packages
php-curl - CURL module for PHP [default]
php-dev - Files for PHP module development (default)
php-gd - GD module for PHP [default]
php-gmp - GMP module for PHP [default]
php-ldap - LDAP module for PHP [default]
php-mysql - MySQL module for PHP [default]
php-odbc - ODBC module for PHP [default]
php-pear - PEAR Base System
php-pgsql - PostgreSQL module for PHP [default]
php-pspell - pspell module for PHP [default]
php-snmp - SNMP module for PHP [default]
php-sqlite3 - SQLite3 module for PHP [default]
php-tidy - tidy module for PHP [default]
php-xml - DOM, SimpleXML, WDDX, XML, and XSL module for PHP [default]
php8.3 - server-side, HTML-embedded scripting language (metapackage)
php8.3-cgi - server-side, HTML-embedded scripting language (CGI binary)
php8.3-cli - command-line interpreter for the PHP scripting language
php8.3-common - documentation, examples and common module for PHP
php8.3-curl - CURL module for PHP
php8.3-dev - Files for PHP8.3 module development
php8.3-gd - GD module for PHP
php8.3-gmp - GMP module for PHP
php8.3-ldap - LDAP module for PHP
php8.3-libidn - IDN module for PHP
php8.3-mbstring - mbstring module for PHP
```

### 2.2. Instalați pachetele "apache2", "php", "php-ldap", "libapache2-mod-php"

A fost nevoie sa dezinstalez tot:

# Oprește Apache

```
sudo systemctl stop apache2
```

# Dezactivează modulul PHP 5.6

```
sudo a2dismod php5.6
```

# Dezinstalare completă PHP 5.6

```
sudo apt-get purge -y php5.6 php5.6-* libapache2-mod-php5.6
```

# Curățare

```
sudo apt-get autoremove -y
```

```
sudo apt-get autoclean
```

```
ubuntu@ubuntu-VirtualBox:~$ sudo apt-get install -y php7.4 php7.4-ldap libapache2-mod-php7.4 php7.4-xml php7.4-mbstring php7.4-gd
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following additional packages will be installed:
  libsodium23 php-common php7.4-cli php7.4-common php7.4-json php7.4-opcache php7.4-readline
Suggested packages:
  php-pear
The following NEW packages will be installed:
  libapache2-mod-php7.4 libsodium23 php-common php7.4 php7.4-cli php7.4-common php7.4-gd php7.4-json php7.4-ldap php7.4-mbstring php7.4-opcache php7.4-readline php7.4-xml
0 upgraded, 13 newly installed, 0 to remove and 117 not upgraded.
```

Am activat PHP 7.4 in Apache:

```
ubuntu@ubuntu-VirtualBox:~$ sudo a2enmod php7.4
Considering dependency mpm_prefork for php7.4:
Considering conflict mpm_event for mpm_prefork:
Considering conflict mpm_worker for mpm_prefork:
Module mpm_prefork already enabled
Considering conflict php5 for php7.4:
Module php7.4 already enabled
ubuntu@ubuntu-VirtualBox:~$
```

2.3. Instalati pachetul "phpldapadmin" folosind comanda

```
ubuntu@ubuntu-VirtualBox:~$ sudo apt-get install --reinstall phpldapadmin
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following NEW packages will be installed:
  phpldapadmin
```

2.3.1 Puteți observa în directorul "/etc/phpldapadmin" fișierele de configurare instalate

```
ubuntu@ubuntu-VirtualBox:~$ ls -l /etc/phpldapadmin/
total 40
-rw-r--r-- 1 root root      992 Jan 21  2024 apache.conf
-rw-r--r-- 1 root www-data 28390 Nov 23  11:55 config.php
drwxr-xr-x 4 root www-data 4096 Nov 23  11:54 hooks
drwxr-xr-x 4 root www-data 4096 Nov 23  11:55 templates
```

2.3.2. Puteți observa activarea configurației modulului phpldapadmin în serverul apache:

```
ubuntu@ubuntu-VirtualBox:~$ ls -l /etc/apache2/conf-enabled/phpldapadmin.conf
lrwxrwxrwx 1 root root 35 Nov 23  11:55 /etc/apache2/conf-enabled/phpldapadmin.conf -> ../conf-available/phpldapadmin.conf
ubuntu@ubuntu-VirtualBox:~$ ls -l /etc/apache2/conf-available/phpldapadmin.conf
lrwxrwxrwx 1 root root 29 Nov 23  11:55 /etc/apache2/conf-available/phpldapadmin.conf -> /etc/phpldapadmin/apache.conf
ubuntu@ubuntu-VirtualBox:~$
```

- 2.4. Modificați în fișierul "/etc/phpldapadmin/config.php" liniile de mai jos cu conținutul indicat:

```
$servers->setValue('server','host','127.0.0.1');

/* The port your LDAP server listens on (no quotes). 389 is standard. */
// $servers->setValue('server','port',389);

/* Array of base DN's of your LDAP server. Leave this blank to have phpLDAPadmin
   auto-detect it for you. */
$servers->setValue('server','base',array('dc=aso,dc=cs,dc=utcluj,dc=ro'));

/* The DN of the user for phpLDAPadmin to bind with. For anonymous binds or
   'cookie','session' or 'sasl' auth_types, LEAVE THE LOGIN_DN AND LOGIN_PASS
   BLANK. If you specify a login_attr in conjunction with a cookie or session
   auth_type, then you can also specify the bind_id/bind_pass here for searching
   the directory for users (ie, if your LDAP server does not allow anonymous
   binds. */
$servers->setValue('login','bind_id','cn=admin,dc=aso,dc=cs,dc=utcluj,dc=ro');
# $servers->setValue('login','bind_id','cn=Manager,dc=example,dc=com');

/* Hide the warnings for invalid objectClasses/attributes in templates. */
$config->custom->appearance['hide_template_warning'] = true;

ubuntu@ubuntu-VirtualBox:~$ sudo nano /etc/phpldapadmin/config.php
ubuntu@ubuntu-VirtualBox:~$ sudo systemctl restart apache2
ubuntu@ubuntu-VirtualBox:~$
```

A trebuit sa modific si fisierul asta:

```
sudo nano /usr/share/phpldapadmin/lib/functions.php
```

la lini 361 sa schimb din:

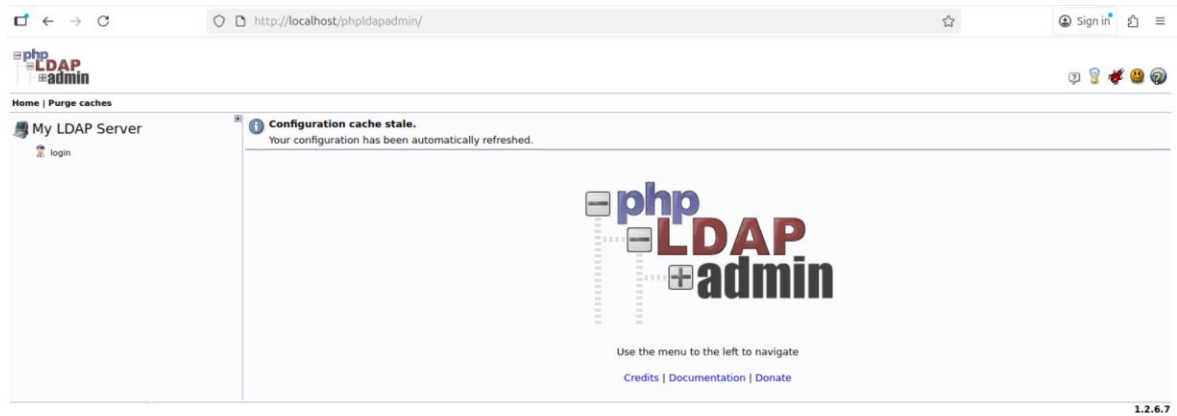

```
[$int, $mod] = [intval($match[1]), $match[2]]; in
```

```
$int = intval($match[1]);
```

```
$mod = $match[2];
```

Pentru ca sintaxa nu era compatibila

2.5. Folosind "Firefox Web Browser" accesati pagina

2.6. Conectați-vă folosind utilizatorul "admin" și parola setată inițial.  
m-am conectat cu: cn=admin,dc=aso,dc=cs,dc=utcluj,dc=ro si parola setata

3. Creați următoarele intrări (grupuri și utilizatori POSIX):

I-am create din interfata web, ex:

The image shows two screenshots from a web-based LDAP management interface.

The top screenshot is a form for creating or editing an LDAP entry. It contains the following fields and values:

- cn**: Gheorghe Gheorghescu (required, alias)
- gidNumber**: 500 (required, alias, asusers {})
- givenName**: Gheorghe (required, alias)
- homeDirectory**: /home/users/ggheorghescu (required, alias)
- loginShell**: /bin/bash (required, alias)
- objectClass**: inetOrgPerson (structural), posixAccount, top (required, alias)
- Password**: [masked] (required, alias, md5)
- sn**: Gheorghescu (required, alias)
- uidNumber**: 1001 (required, alias)
- User Name**: ggheorghescu (required, alias, modify group members)

An "Update Object" button is located at the bottom of the form.

The bottom screenshot shows a directory tree view titled "My LDAP Server". The tree structure is as follows:

- dc=aso, dc=cs, dc=utcluj, dc=ro (2)
  - ou=groups (1)
    - cn=asousers
    - Create new entry here
  - ou=users (2)
    - cn=Gheorghe Gheorghescu
    - cn=Ion Ionescu
    - Create new entry here

4. Folosiți comanda pentru a verifica configurația utilizatorilor existenți în baza de date LDAP.

```
ubuntu@ubuntu-VirtualBox:~/Desktop$ ldapsearch -x -b "dc=aso,dc=cs,dc=utcluj,dc=ro" -s sub "cn=*"
# extended LDIF
#
# LDAPv3
# base <dc=aso,dc=cs,dc=utcluj,dc=ro> with scope subtree
# filter: cn=*
# requesting: ALL
#
# Ion Ionescu, users, aso.cs.utcluj.ro
dn: cn=Ion Ionescu,ou=users,dc=aso,dc=cs,dc=utcluj,dc=ro
givenName: Ion
sn: Ionescu
uid: iionescu
uidNumber: 1000
gidNumber: 500
homeDirectory: /home/users/iionescu
loginShell: /bin/bash
objectClass: inetOrgPerson
objectClass: posixAccount
objectClass: top
cn: Ion Ionescu

# Gheorghe Gheorghescu, users, aso.cs.utcluj.ro
dn: cn=Gheorghe Gheorghescu,ou=users,dc=aso,dc=cs,dc=utcluj,dc=ro
givenName: Gheorghe
sn: Gheorghescu
uid: ggheorghescu
uidNumber: 1001
gidNumber: 500
homeDirectory: /home/users/ggheorghescu
loginShell: /bin/bash
objectClass: inetOrgPerson
objectClass: posixAccount
objectClass: top
cn: Gheorghe Gheorghescu

# asousers, groups, aso.cs.utcluj.ro
dn: cn=asousers,ou=groups,dc=aso,dc=cs,dc=utcluj,dc=ro
gidNumber: 500
objectClass: posixGroup
objectClass: top
cn: asousers

# search result
search: 2
result: 0 Success

# numResponses: 4
# numEntries: 3
ubuntu@ubuntu-VirtualBox:~/Desktop$
```

## 5. Configurarea *apache2* pentru autentificarea prin Open LDAP

### 5.1. Accesati <https://localhost> #observati ca nu se cere autentificare

A trebuit sa accesez <http://localhost>, nu varianta https

🔒 📄 http://localhost

## Apache2 Default Page

# Ubuntu

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

### Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
- They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers `a2enmod`, `a2dismod`, `a2ensite`, `a2dissite`, and `a2enconf`, `a2disconf`. See their respective man pages for detailed information.
- The binary is called `apache2` and is managed using `systemd`, so to start/stop the service use `systemctl start apache2` and `systemctl stop apache2`, and use `systemctl status apache2` and `journalctl -u apache2` to check status. `system` and `apache2ctl` can also be used for service management if desired. **Calling `/usr/bin/apache2` directly will not work** with the default configuration.

### Document Roots

By default, Ubuntu does not allow access through the web browser to *any* file outside of those located in `/var/www`, **public\_html** directories (when enabled) and `/usr/share` (for web applications). If your site is using a web document root located elsewhere (such as in `/srv`) you may need to whitelist your document root directory in `/etc/apache2/apache2.conf`.

- 5.2. Din terminal activati modulul ldap folosind comanda

```
ubuntu@ubuntu-VirtualBox:~$ sudo a2enmod ldap authnz_ldap
Enabling module ldap.
Considering dependency ldap for authnz_ldap:
Module ldap already enabled
Enabling module authnz_ldap.
To activate the new configuration, you need to run:
    systemctl restart apache2
ubuntu@ubuntu-VirtualBox:~$
```

- 5.3. Creați fișierul "/etc/apache2/conf-enabled/auth\_ldap.conf" cu conținutul de mai jos.

```
ubuntu@ubuntu-VirtualBox:~/Desktop$ cat /etc/apache2/conf-available/auth_ldap.conf
<IfModule authnz_ldap_module>
  <Directory /var/www/html>
    Options Indexes FollowSymLinks
    AllowOverride None

    AuthName "LDAP Authentication Required"
    AuthType Basic
    AuthBasicProvider ldap
    AuthLDAPURL "ldap://127.0.0.1/ou=users,dc=aso,dc=cs,dc=utcluj,dc=ro?uid?sub?(objectClass=inetOrgPerson)"
    AuthLDAPBindDN "cn=admin,dc=aso,dc=cs,dc=utcluj,dc=ro"
    AuthLDAPBindPassword "1234"

    Require valid-user
  </Directory>
</IfModule>
ubuntu@ubuntu-VirtualBox:~/Desktop$
```

Metoda cu "/etc/apache2/conf-enabled/auth\_ldap.conf" e inechita, a  
trebuie sa fa ca in poza de mai sus si dupa:  
Creare symlink: sudo a2enconf auth\_ldap

- 5.4. Reporniti serverul de apache

```
ubuntu@ubuntu-VirtualBox:~$ sudo apache2ctl restart
AH00558: apache2: Could not reliably determine the server's fully qualified domain name, using 127.0.0.1. Set the 'ServerName' directive globally to suppress this message
ubuntu@ubuntu-VirtualBox:~$
```

- 5.5. Acesati iarasi `https://localhost` #observati ca se solicita autentificare.Folositi un user adaugat cu `phpLDAPadmin`

http://localhost

Ubuntu's Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|-- ports.conf
|-- mods-enabled
|-- *.load
|-- *.conf
|-- conf-enabled
|-- *.conf
|-- sites-enabled
|-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
- They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers `a2enmod`, `a2dismod`, `a2ensite`, `a2dissite`, and `a2enconf`, `a2disconf`. See their respective man pages for detailed information.
- The binary is called `apache2` and is managed using `systemd`, so to start/stop the service use `systemctl start apache2` and `systemctl stop apache2`, and use `systemctl status apache2` and `journalctl -u apache2` to check status. `system` and `apache2ctl` can also be used for service

```
ubuntu@ubuntu-VirtualBox:~/Desktop$ curl -u tionescu:1234 http://localhost
```

Caution: You are using the Snap version of curl.  
Due to Snap's sandbox nature, this version has some limitations.  
For example, it may not be able to access hidden folders in your home directory  
or other restricted areas of the os.

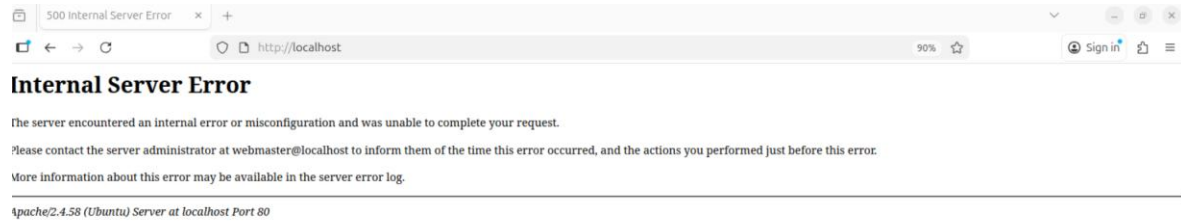

Which means you may encounter errors when using snap curl to download and execute some script.  
For those cases, you might want to use the native curl package.  
For details, see: <https://github.com/boukendesho/curl-snap/issues/1>

To stop seeing this message, run the following command:  
\$ curl.snap-acked

```
